

Recipe Finder Application

Problem Statement:

Create a recipe finder app that lets users:

1. Search Recipes:

- Type ingredients into an input field and press Enter.
- Fetch matching recipes stored as an **array of objects**.

2. Bonus Features:

- Allow recipe filtering by type (e.g., Lunch, Breakfast) using a dropdown menu.

These cases involve realistic scenarios to ensure hands-on learning of JavaScript fundamentals. Let me know if you'd like detailed implementation steps for any of these!
